Orthopaedic Surgery Residency Program

Orthopaedic education is a dynamic process. It begins before medical school and continues throughout the years of the surgeon's practice. Because the discipline of orthopaedic surgery is progressing so rapidly, orthopedists must constantly update their knowledge and skills and be willing to critically appraise their own work. It is our goal to promote self-directed, life long learning skills. In our residency program, emphasis is placed on assisting each resident in gaining basic knowledge, clinical and surgical skills and then help them apply these principles in practice.

Our residents play an active role in this educational process. Departmental teaching conferences are held each morning and each clinical service also holds a specialty conference during the week. Resident research participation is also a part of teaching and the learning process. Each resident is expected to participate in research projects with a manuscript and publication prior to graduation.
